

Figure (Forest Plot) — 95% Confidence Intervals for L3 – L0

Metric: ROC-AUC (classification) or Pearson r (regression, marked [r]) · Diamond = mean Δ · Bar = 95% CI (t-distribution, n=20) · Red dashed line = null ($\Delta=0$)
All CIs cross zero except SchNet/QM9 — consistent with no statistically detectable L3–L0 difference across these tasks and architectures.

★ SchNet/QM9 CI does not cross zero — but this reflects SchNet L0 ($r=0.541$) being anomalously low (radial filter requires bond-distance coherence); not evidence for general geometric sensitivity

[r] = regression task (Pearson r metric) · All other entries = classification (ROC-AUC)
